

MIDAS GUI — Development History

A commit-by-commit record of what changed and when, so you can (a) find **when** a particular behaviour/feature entered the code and (b) know **what to roll back** to undo a specific effect.

Keep this file updated when you add commits: append a new entry at the bottom of the chronological log and add a row to the quick-reference index. Regenerate the PDF the same way as the other docs (pandoc + headless Chrome) if you keep one.

How to use this document

- **Find when a change landed:** search the change → commit index below, or `git log --oneline -- <path>` for a specific file, or `git log -S"<code string>"` to find the commit that introduced/removed a string.
- **See a commit's exact diff:** `git show <hash>` (whole commit) or `git show <hash> -- <path>` (one file).
- **Undo one commit cleanly (keeps later history):** `git revert <hash>`. For a range: `git revert <oldest>^..<newest>`.
- **Undo just one file back to a commit:** `git checkout <hash> -- <path>` then commit. To see the file *as of* a commit without changing anything: `git show <hash>:<path>`.
- **Hard reset to a point (destructive — local only, never on pushed history):** `git reset --hard <hash>`. Prefer `git revert` on a shared branch.
- **Dependencies matter.** Many later commits build on earlier ones (e.g. the unified data-loader, the config overlay). The "Roll back" note on each entry flags when reverting will disturb dependents.

Branch: `main`. All commits are authored by Dishant Beniwal (AI pair-authored). Dates are commit dates (YYYY-MM-DD).

Change → commit quick-reference index

Packaging / build / launch

Change	Commit
Initial v1.0.0 release (9-tab app, all backends)	f19ee8c
setuptools.build_meta backend (broader pip compat)	3cd1f36
<code>launch.py</code> standalone launcher	2e9f419
Startup crash diagnostics + robust launcher (Windows)	916ece2
MIDAS-style packaging (LICENSE, pyproject, release.sh, smoke tests)	e862135

Change	Commit
Ship test_data sample data in the repo (fresh clone works out of the box)	7e157e0
Drop midas_suite from env (unblock conda env create; backends via -e .)	72a1770
Pin environment.yml to verified NumPy-1 set + README recreate steps	68313f8

Data Viewer (Tab 0)

Change	Commit
Radial-integration plot, beam-centre ring picking, zoom persistence	acf0866
Zoom/pan preserved across frames (autoRange off)	d9e527e
Intensity-range mask, calibration-file loading, click-to-draw ring	d50b588
Compact 3-per-row lattice + cubic quick-set; mask default max(99.99pct, 1e5)	41f28f5
Projection Skip-frames field; compact geometry/intensity fields; Lsd separators	108ea7d
Intensity-statistics panel + histogram (bottom of loader)	2b7a695

Mask Builder (Tab 1)

Change	Commit
Unbounded σ fields; independent spatial/temporal auto-mask; Viewer↔Calibrate geometry hand-off	10df828
Temporal-constancy accepts a 3-D HDF5 (time,y,x) stack	2385f75

Calibrate (Tab 2) / Refinement (Tab 3)

Change	Commit
Abort buttons; dark/bright/background field correction; auto-load on browse	7d010d7
Calibration input accepts paramtest/poni/json	41f28f5
Load-calibration-file (geometry + λ) helpers	b381d8d
Multi-column paramtest results readout + Send-to-Data-Viewer button	455ca4e
Calibrate Results all-text (drop distortion table; named distortion, bigger font)	3a6ecb9
Fix calibrate() initial_BC_y TypeError (kwargs filter) + pin scikit-image	b1642fa

Batch Integrate (Tab 4)

Change	Commit
Live folder MONITOR + per-file legend	1149afc
Clear results + inline per-file labels & plot controls	524f5f1

Change	Commit
Stacked profiles: publication themes, point+line, symbol size, x-units, grid	d135c80
Waterfall R/2θ/Q x-axis selector	2385f75

PDF Analysis (Tab 6)

Change	Commit
Polyatomic midas_pdf reduction pipeline + vendored midas_pdf + calibration loading	b381d8d
Defaults to real I(Q) test data	1149afc

Pump Probe (TR-XRD) tab

Change	Commit
New tab: TRR pooling + MIDAS-engine integration + $\Delta I(q, \text{delay})$ + 4 pyqtgraph views + publication-quality plots + default MIDAS calibration	590b410

Cross-cutting UI / infrastructure

Change	Commit
Linux visible files/folders style fix	fc754d0
Pixel-weighted azimuthal mean; readable QMenu; no-scroll combos	41f28f5
Unified Data-Loader panel + draggable 3-panel splitter (tabs 0/2/3/4)	aa9395e
Clickable λ label with K-edge foil menu	b628446
Clickable px label with detector pixel-size menu	3248638
Per-user JSON configuration system + Preferences dialog	d30be2c
Modular tab visibility (show/hide optional tabs)	590b410
User-adjustable interface scaling (HiDPI / 4K, QT_SCALE_FACTOR)	d5fafd8
Default optional tabs reduced (Corrections/PDF/Texture/Export hidden)	7e157e0
Lsd displayed in mm (calculations & calibration files stay in μm)	c4e1c12
Fix "Populating font family aliases" warning (real fixed-width fonts)	d6df1f8
Fix fresh-env launch crash — colormap resolution without matplotlib	6332b3d

Stability / performance / consistency (review-driven, phases 1–3)

Change	Commit
Clean worker shutdown, drop QThread.terminate(), guard stdout, offload projection	399f3d7
Waterfall $O(N^2) \rightarrow O(N)$, frame-slider debounce, radial-grid + stats caching	4462ee1

Change	Commit
Dedupe distortion map + paramstest writer, align calibrant lattices, texture colormap	8846619

Documentation

Change	Commit
README not-on-PyPI clone/conda instructions	cd05ced
gui_documentation.md added	2e5f7c9
gui_documentation.pdf added	75c135c
README/environment install via <code>pip install midas_suite</code>	aceb40f
implementation_details.md/.pdf added	524f5f1
config_gui.md + config.example.json added	d30be2c
development_history.md/.pdf added	6d6f3fb

Chronological commit log (oldest → newest)

f19ee8c — Initial release: midas_gui v1.0.0 (2026-06-30)

Effect: First version. Nine-tab PyQt5 GUI over `midas_calibrate_v2` / `midas_integrate_v2`: mask building, auto-calibration, refinement, batch integration + waterfall, corrections, PDF, texture, export. Entry points `midas-gui` / `python -m midas_gui`. **Files:** entire `midas_gui/` package + `pyproject.toml`, `README`, `environment.yml`. **Roll back:** this is the root — everything depends on it; don't revert.

3cd1f36 — setuptools.build_meta backend (2026-06-30)

Effect: Build backend switched for `setuptools≥61` compatibility. **Files:** `pyproject.toml`. **Roll back:** `git revert 3cd1f36` (only affects builds).

2e9f419 — add launch.py standalone launcher (2026-06-30)

Effect: `python /path/to/launch.py` runs the app from anywhere. **Files:** `launch.py`. **Roll back:** safe to revert; later hardened by `916ece2`.

fc754d0 — Linux style fix for invisible files/folders (2026-06-30)

Effect: Stylesheet fix so file/folder text is visible on Linux. **Files:** `midas_gui/style.py`. **Roll back:** `git revert fc754d0` (cosmetic).

acf0866 — Data Viewer: radial plot, ring picking, zoom persistence (2026-06-30)

Effect: Added the radial-integration plot, beam-centre ring picking, and zoom-persistence across a stack in the Data Viewer; widened left panels. **Files:** `tab_view.py` (+1-line width bumps in other tabs). **Roll back:** revert to remove the Data Viewer radial plot/ring picking.

d9e527e — preserve zoom/pan across frames (2026-06-30)

Effect: Disabled pyqtgraph autoRange on redisplay so zoom/pan survive frame changes. **Files:** `widgets.py`. **Roll back:** revert if you *want* auto-refit per frame.

d50b588 — Data Viewer: intensity mask, calib loading, click-to-draw ring (2026-07-01)

Effect: 99.9-pct intensity-range mask default; load calibration (`json/poni/paramtest`); click-to-draw ring; test-data defaults point at local `test_data/`. **Files:** `tab_view.py`, `widgets.py`, `helpers.py`, `constants.py`, `tab_mask.py`. **Roll back:** revert to drop these Data Viewer features (note `helpers.py` geometry parsing added here is reused later — see `b381d8d`).

916ece2 — startup crash diagnostics + robust launcher (2026-07-01)

Effect: Logs uncaught exceptions/native faults to `~/midas_gui_error.log`, prevents PyQt slot-exception aborts, isolates failing tabs, hardens the launcher. **Files:** `app.py`, `launch.py`. **Roll back:** revert only if you want raw exceptions to propagate; not recommended.

7d010d7 — Abort buttons + dark/bright/background + auto-load (2026-07-01)

Effect: Abort on calibrate/batch; dark/bright/background field correction (`file/folder/HDF5`, index-range averaging, divide/subtract); browse auto-loads, "Load" buttons removed; compact FieldSelector. **Files:** `tab_batch/calibrate/corrections/mask/pdf/refine/texture/view.py`, `widgets.py`, `workers.py`, `helpers.py`. **Roll back:** wide-reaching; reverting removes field correction + auto-load across tabs. The Abort behaviour here was later re-worked by `399f3d7` (no `terminate()`).

e862135 — MIDAS-style packaging (2026-07-01)

Effect: BSD-3 LICENSE, MIDAS-convention `pyproject.toml`, `release.sh` + `RELEASING.md`, headless tests/ smoke suite. **Files:** `LICENSE`, `README.md`, `RELEASING.md`, `pyproject.toml`, `release.sh`, `tests/`. **Roll back:** revert affects packaging/tests only.

41f28f5 — compact lattice, pixel-weighted azimuthal mean, readable menus (2026-07-06)

Effect: Data Viewer 3-per-row lattice + cubic quick-set; intensity-mask default `max(99.99pct, 1e5)`; **pixel-weighted azimuthal mean** (selectable vs legacy η -bin mean) fixing off-detector-BC distortion; batch calibration accepts `paramtest/poni/json`; readable right-click menus; no-scroll combos. **Files:** `helpers.py`, `workers.py`, `tab_view/batch/calibrate/pdf/refine/texture.py`, `widgets.py`, `style.py`. **Roll back:** to undo the azimuthal-averaging change specifically, prefer editing the `weighted` default rather than reverting the whole commit (it bundles UI changes).

cd05ced — docs: not-on-PyPI install instructions (2026-07-06)

Effect: README clone+conda+run instructions; relative env self-install. **Files:** `README.md`, `environment.yml`. **Roll back:** docs only.

2e5f7c9 — docs: add gui_documentation.md (2026-07-06)

Effect: First committed user guide. **Files:** `documentation/gui_documentation.md`. **Roll back:** docs only.

75c135c — docs: add gui_documentation.pdf (2026-07-06)

Effect: PDF build of the guide. **Files:** `documentation/gui_documentation.pdf`. **Roll back:** docs only.

aceb40f — docs: install via pip install midas_suite (2026-07-06)

Effect: Corrected backend-install instructions. **Files:** `README.md`, `environment.yml`. **Roll back:** docs only.

aa9395e — Unified Data-Loader panel + 3-panel splitter (tabs 0/2/3/4) (2026-07-07)

Effect: Shared `DataLoaderPanel` (Data/Dark/Bright/Background/Mask, per-mode frame controls) + `MaskSelector`; corrections applied on tabs 0/2/3/4; each of those tabs restructured into a draggable `[Data Loader | Parameters | Display]` splitter. **Files:** `widgets.py` (+442), `tab_view/calibrate/batch/refine.py` (large rewrites), `app.py`, `helpers.py`, `workers.py`, docs. **Roll back: high impact** — this is the base for the Batch/Calibrate/Refine and later Pump Probe layouts. Reverting breaks the 3-panel tabs and the Pump Probe tab's left panel. Avoid a blanket revert; fix forward instead.

b381d8d — Tab 6 polyatomic midas_pdf pipeline + calibration loading (2026-07-08)

Effect: PDF tab rewritten to the total-scattering pipeline; **vendored** `midas_pdf` under `midas_gui/_vendor/` + `pdf_backend.py`; helpers `geometry_fields_from_file` / `result_ns_from_geometry_file` (paramtest/json/poni) used by Calibrate and PDF "Load calibration file...". **Files:** `_vendor/midas_pdf/**` (new, large), `pdf_backend.py`, `tab_pdf.py`, `workers.py`, `helpers.py`, `tab_calibrate.py`, `constants.py`, `pyproject.toml`, docs. **Roll back:** reverting removes the PDF pipeline **and** the shared geometry-file loaders that later tabs (incl. Pump Probe via `spec_from_geometry_file`) rely on — revert with care.

1149afc — Batch live MONITOR + legend; PDF real-data default (2026-07-08)

Effect: MONITOR button (stream mode) watches a folder and integrates new frames via `FolderMonitorWorker`, reusing a cached detector map (factored `build_integration_context()` + `write_profile()`, shared with `BatchWorker`); per-file legend; PDF tab defaults to real I(Q). **Files:** `tab_batch.py`, `workers.py`, `widgets.py`, `constants.py`, `tab_pdf.py`, docs. **Roll back:** to remove MONITOR only, revert this commit — but `build_integration_context()` introduced here is **reused by the Pump Probe worker** (590b410), so a full revert would break Pump Probe integration.

524f5f1 — Batch Clear results + inline labels; implementation-details doc (2026-07-09)

Effect: "Clear results" button; inline per-file curve labels + line-width/font toolbar on stacked profiles; new `implementation_details.md/.pdf`. **Files:** `tab_batch.py`, `widgets.py`, `documentation/implementation_details.*`. **Roll back:** safe, localized to Batch + the new doc.

10df828 — Mask unbounded σ + split auto-mask; Viewer↔Calibrate geometry (2026-07-09)

Effect: Removed σ upper limits; split statistical auto-mask into independent Spatial-outlier / Temporal-constancy checkboxes; geometry hand-off `DataViewer.pushGeometry` / `Calibrate.pullGeometry` → `apply_geometry`. **Files:** `tab_mask.py`, `tab_view.py`, `tab_calibrate.py`, `app.py`, `workers.py`, docs. **Roll back:** revert to restore bounded σ / combined auto-mask / no geometry hand-off.

d135c80 — Batch stacked-profiles: themes, point+line, x-units, grid (2026-07-09)

Effect: `StackedProfileViewer` publication/dark themes, point+line, symbol-size, R/2 θ /Q x-unit selector, grid toggle. (This viewer's styling is the template the Pump Probe plots later mirror.) **Files:** `widgets.py` (+228), `tab_batch.py`, docs. **Roll back:** localized to the Batch stacked-profile viewer.

2385f75 — Batch waterfall R/2 θ /Q axis; Mask 3-D HDF5 stack (2026-07-10)

Effect: Waterfall x-unit selector via a converting `AxisItem` + `_convert_radial()`; Mask temporal-constancy reads a single 3-D (time,y,x) HDF5. **Files:** `widgets.py`, `tab_batch.py`, `tab_mask.py`, `workers.py`, docs. **Roll back:** `_convert_radial` / `_UnitAxis` introduced here are reused by the Pump Probe heatmap — don't fully revert if Pump Probe is present.

b628446 — clickable λ label with K-edge foil menu (2026-07-10)

Effect: Compact clickable " λ " label $\rightarrow$ K-edge foils menu (sets λ from edge energy). `constants.K_EDGE_FOILS`, `HC_KEV_A`, `helpers.make_kedge_label`. **Files:** `constants.py`, `helpers.py`, `tab_view/calibrate/pdf.py`, docs. **Roll back:** localized; `make_pixel_label` (next) reuses the factored helper.

108ea7d — Data Viewer projection Skip-frames + compact fields (2026-07-10)

Effect: Projection "Skip frames" field; narrower Axis/Skip/pixel fields; Lsd thousands-separators. **Files:** `tab_view.py`, docs. **Roll back:** localized.

3248638 — clickable px label with detector pixel-size menu (2026-07-10)

Effect: Clickable "px" label $\rightarrow$ GE/Varex/Pilatus/Eiger sizes; `constants.PIXEL_PRESETS`; factored `helpers._clickable_menu_label`. **Files:** `constants.py`, `helpers.py`, `tab_view.py`, `tab_calibrate.py`, docs. **Roll back:** localized.

2b7a695 — Data Viewer intensity-statistics panel + histogram (2026-07-10)

Effect: `IntensityStatsPanel` (histogram + p70/p90/p99/p99.9/p99.99 with pixel counts) pinned to the loader bottom (stack mode); Current/All/projected scope. **Files:** `widgets.py`, `tab_view.py`, docs. **Roll back:** localized.

d30be2c — per-user configuration system + Preferences dialog (2026-07-12)

Effect: Per-user JSON config overlays shipped defaults at import; `settings.py`; `prefs_dialog.py` (Geometry/Paths/Materials/Calibrants/Menus/Algorithms); Settings menu; `DEFAULT_KERNEL/PIPELINE/OUTPUT_FORMAT/ERROR_MODEL/COLORMAP`; tab combos honor configured defaults. New `config_gui.md`, `config.example.json`, `tests/test_config.py`. **Files:** `settings.py` (new), `prefs_dialog.py` (new), `constants.py` (+165), `app.py`, `tab_batch.py`, `tab_calibrate.py`, `widgets.py`, docs, tests. **Roll back: high impact** — the config overlay + `DEFAULT_*` and the Preferences dialog are extended by the modular-tabs commit (590b410). Reverting this would also break `ui.visible_tabs` and the Tabs preferences section.

399f3d7 — Stability: clean worker shutdown, no terminate(), stdout guard (2026-07-12)

Effect: `closeEvent` stops all tab QThreads; removed every `QThread.terminate()` (cooperative interrupt + orphan instead); `CalibrationWorker` restores stdout only if still its own; Data Viewer projection moved to `ProjectionWorker` (off GUI thread). **Files:** `app.py`, `tab_batch.py`, `tab_calibrate.py`, `tab_view.py`, `workers.py`. **Roll back:** reverting reintroduces the exit hard-crash risk and UI-freeze on projection — not recommended. Phase 1 of the 3-part review.

4462ee1 — Performance: waterfall O(N), debounce, caching (2026-07-12)

Effect: Waterfall pre-allocated buffer + 100 ms coalesced redraw ($O(N)$ not $O(N^2)$); 60 ms frame-slider debounce; cached radial bin-index grid; skip all-frame stats on frame-only changes. **Files:** `tab_view.py`, `widgets.py`. **Roll back:** reverting slows large scans / scrubbing; behaviour otherwise same. Phase 2 of the review.

8846619 — Consistency: dedupe maps/writer, align lattices (2026-07-12)

Effect: `helpers._PARAMSTEST_DISTORTION` derived from `constants._V2_T0_V1` (removed duplicated `_V2V1` dicts); shared `helpers.write_standalone_paramstest` used by Calibrate + Export; `LaB6/Si_LATT/_LC` aligned to `MATERIALS`; texture colormap honors `DEFAULT_COLORMAP`. **Files:** `constants.py`, `helpers.py`, `tab_calibrate.py`, `tab_export.py`, `tab_texture.py`. **Roll back:** reverting reintroduces duplicated code paths; low functional risk. Phase 3 of the review.

590b410 — Modular tabs + Pump Probe (TR-XRD) tab + plot quality (2026-07-12)

Effect: (1) **Modular tab visibility** — Data Viewer/Mask/Calibrate/Batch always shown, the rest toggled in Settings ▶ Preferences ▶ Tabs (`ui.visible_tabs`, applied live); `app.apply_tab_visibility()`. (2) **New Pump Probe tab** (`tab_pumpprobe.py`) — TRR filename pooling, MIDAS-engine integration via new `PumpProbeWorker` (reuses `build_integration_context / integrate_frame`), $\Delta I(q, \text{delay})$, three-panel layout, four pyqtgraph views; ships a converted MIDAS `paramstest` as the default calibration. (3) **Plot quality** — white publication theme, black axes/labels/titles, readable legends, ΔI colorbar, aligned reference panel, shared draw-mode + line/point/font-size toolbar, bounded pan/zoom. **Files:** `tab_pumpprobe.py` (new), `workers.py` (+ `PumpProbeWorker`), `app.py`, `constants.py`, `prefs_dialog.py`, `tests/test_smoke.py`, `docs(gui_documentation, config_gui, config.example.json)`. **Roll back:** to remove **only Pump Probe**, delete `tab_pumpprobe.py` and its wiring in `app.py / workers.py`; to remove **only modular tabs**, revert the `app.apply_tab_visibility / prefs_dialog` Tabs section and `constants` tab lists. A full `git revert 590b410` removes both features together. Depends on `aa9395e` (`DataLoaderPanel`), `1149afc` (`build_integration_context`), `2385f75` (`_convert_radial / _UnitAxis`), `d30be2c` (`config/prefs`).

6d6f3fb — docs: add development_history.md/.pdf (2026-07-13)

Effect: Added this per-commit change log + change→commit index + rollback guide. **Files:** `documentation/development_history.md`, `documentation/development_history.pdf`. **Roll back:** docs only.

d5fafd8 — UI scaling: user-adjustable whole-interface zoom (HiDPI / 4K) (2026-07-13)

Effect: Whole-application scale (layout + fonts) for HiDPI / 4K monitors. `constants.DEFAULT_UI_SCALE` (config `ui.ui_scale`); `app.main()` applies it via `QT_SCALE_FACTOR` **before** the `QApplication` is created (so fixed widths, splitters, pyqtgraph and stylesheet px all scale uniformly) + `AA_UseHighDpiPixmaps`. Manual control in **Preferences ▶ Display** (spin + 100/125/150/200 % presets) and **Settings ▶ Interface scaling...**; both persist `ui.ui_scale` and offer an immediate self-restart (`MainWindow.restart_app` via `QProcess`) since the factor is read only at startup. **Files:** `constants.py`, `app.py`, `prefs_dialog.py`, `docs(gui_documentation, config_gui, config.example.json)`. **Roll back:** `git revert d5fafd8`. Self-contained (depends only on the config system `d30be2c`); reverting removes the scale control and the app renders at 1.0x. To keep the feature but disable it, set `ui.ui_scale` to 1.0.

c4e1c12 — Display Lsd in mm (calculations & files stay in μm) (2026-07-13)

Effect: The sample-to-detector distance is entered/shown in **mm** in the Data Viewer, the Calibrate seed, and Preferences ▶ Geometry; conversion to/from μm happens only at the display boundary (`DataViewerTab._lsd_um()`, $\times 1000$ on read, $\div 1000$ on set). `get_geometry / apply_geometry / manual_seed / prefs _assemble` still emit μm ; the config key stays `lsd_um` (μm); calibration-file writers (`paramtest.txt`, `calibration.json`) are unchanged (always μm). Batch drift-status label → mm. **Files:** `tab_view.py`, `tab_calibrate.py`, `prefs_dialog.py`, `tab_batch.py`, `docs`. **Roll back:** `git revert c4e1c12` to return every Lsd field to a μm display. Purely a display-layer change — no stored/file/calculation values are affected either way.

d6df1f8 — Fix "Populating font family aliases" startup warning (2026-07-13)

Effect: Removed the `qt.qpa.fonts: Populating font family aliases` warning (and its ~40 ms startup cost) that Qt emitted because the code named the nonexistent family "Monospace" — both via `QFont("Monospace", ...)` and the CSS generic `font-family:monospace`. Now names real per-platform families (Menlo/Consolas/DejaVu Sans Mono/Courier New) via `style.MONO_FAMILIES / MONO_CSS` and `widgets._mono_font()` (`QFont setFamilies + Monospace` style hint). **Files:** `style.py`, `widgets.py`, `tab_export.py`, `tab_view.py`. **Roll back:** `git revert d6df1f8` (cosmetic; only affects fixed-width font selection and re-introduces the harmless warning).

455ca4e — Calibrate: multi-column results readout + Send-to-Data-Viewer (2026-07-13)

Effect: (1) The Calibrate **Results** tab shows the full parameter set exactly as written to `paramtest.txt` (Lsd, BC, tx/ty/tz, p0–p14, Parallax, Wavelength, px, NrPixelsY/Z, RhoD, SpaceGroup, LatticeConstant) in a 3-column, column-major grid (`_paramtest_pairs` via the shared writer + `_populate_param_grid`), with a strain/timing line and the named-distortion table below. (2) New → **Send to Data Viewer** button (`sendGeometryToViewer` signal + `_send_to_viewer`) pushes the calibrated $\lambda/\text{pixel}/\text{Lsd}/\text{beam-centre}$ into the Data Viewer through new `DataViewerTab.set_geometry` (μm internal, Lsd shown mm, auto-BC off); wired in `app.py` as the reverse of the Viewer→Calibrate hand-off. **Files:** `tab_calibrate.py`, `tab_view.py`, `app.py`, `docs`. **Roll back:** `git revert 455ca4e`. Self-contained; depends on the mm-display change (`c4e1c12`) for the Viewer Lsd conversion.

7e157e0 — Ship test_data; hide four optional tabs by default (2026-07-14)

Effect: (1) `test_data/` sample data (`calibrant_ceria.tif/h5`, `nickel_stack.h5`, `nickel_tifs/`, `make_test_data.py`) is now committed so the GUI's default paths work on a fresh clone — `.gitignore` re-includes it past the global `*.tif/*.*h5` ignores via trailing negations, while `test_data/output/`, `out_temp.txt` and `.DS_Store` stay ignored. (2) `DEFAULT_VISIBLE_TABS = ["Calib. Refinement", "Pump Probe"]` — Corrections, PDF Analysis, Texture and Results & Export ship hidden (enable in Preferences ▶ Tabs). **Files:** `.gitignore`, `test_data/**` (added), `constants.py`, `config.example.json`, `tests/test_smoke.py`, `docs`. **Roll back:** `git revert 7e157e0` restores the all-optional-tabs default and removes the shipped data + re-ignores `test_data/`. Note: a per-user config with its own `ui.visible_tabs` overrides the shipped default regardless.

6332b3d — Fix launch crash on fresh Linux/Windows (colormap w/o matplotlib) (2026-07-14)

Effect: Fixes the GUI failing to start on a clean env where every always-on tab's image viewer crashed with `'NoneType' object has no attribute 'getColors'`. Cause: `DEFAULT_COLORMAP "hot"` (and the whole `COLORMAPS` list) are matplotlib colormaps; `pg.colormap.get("hot")` returns `None` without matplotlib, and that `None` was passed into `pyqtgraph`. New `widgets._resolve_cmap()` resolves native → matplotlib → native fallback → grayscale ramp and never returns `None` (used by `ImageViewer`, `WaterfallViewer`, `Texture`); matplotlib added as a declared dependency (`pyproject` + `environment.yml` `matplotlib-base`) so the named maps actually resolve. The downstream "Geometry hand-off wiring failed / QWidget has no attribute `pushGeometry`" log lines were only a symptom of the tabs becoming placeholders and disappear with this fix. **Files:** `widgets.py`, `tab_texture.py`, `pyproject.toml`, `environment.yml`, `tests/test_smoke.py`. **Roll back:** `git revert 6332b3d` (reintroduces the crash on matplotlib-less envs).

72a1770 — env: drop midas_suite (unblocks `conda env create`) (2026-07-14)

Effect: `conda env create -f environment.yml` was aborting because the pip section's `midas_suite` meta-package pulls `midas-index 0.7.3`, whose sdist fails to build against `scikit-build-core>=0.8` (Use `cmake.version` instead of `cmake.minimum-version`). The GUI never uses `midas_suite`'s extras; the backends it actually imports (`midas-calibrate-v2/integrate-v2/calibrate/hkls/distortion`) are declared in `pyproject.toml` and pulled by the editable `-e .` install. Removed the redundant `midas_suite` line; README updated. (Unrelated to the repo: the `libarchive.19.dylib` / `conda-libmamba-solver` errors in that log are a broken base-Anaconda mamba, worked around with `--solver=classic`.) **Files:** `environment.yml`, `README.md`. **Roll back:** `git revert 72a1770` (re-adds `midas_suite` and its build failure).

68313f8 — Pin environment.yml to a verified NumPy-1 set + README recreate steps (2026-07-14)

Effect: Makes `conda env create` reproduce a known-good environment. Fresh installs previously pulled the newest backends (`numba 0.66` → `NumPy 2.x`) against `conda torch 2.2.2`, which can't interop with `NumPy 2` (`torch.from_numpy: Numpy is not available`). Pinned every package to the versions from the user's working base Anaconda — the **NumPy-1 family**: `numpy=1.26.4`, `scipy=1.13.1`, `h5py=3.11.0`, `tifffile=2023.4.12`, `pyqtgraph=0.14.0`, `matplotlib-base=3.8.4` (conda); `PyQt5==5.15.10`, `torch==2.4.0`, `numba==0.59.1`, and the NumPy-1-era MIDAS backends (`calibrate-v2 0.3.3`, `integrate-v2 0.1.0`, `calibrate 0.2.3`, `hkls 0.4.1`, `distortion 0.2.0`) via pip; then `-e .`. Dropped the `conda pytorch/cpuonly` lines + `pytorch`

channel (torch now via pip). `pyproject.toml`: lowered `midas-calibrate` floor 0.2.7 → 0.2.3 so the proven base version satisfies `-e .`. README gains a "Recreating the environment" section (remove + create), a conda-solver/libarchive note, and the CPU-only torch install note. Verified end-to-end: fresh env resolves clean; GUI

- a real nickel-frame integration run (numpy 1.26.4 + torch 2.4.0). **Files:** `environment.yml`, `pyproject.toml`, `README.md`. **Roll back:** `git revert 68313f8` (returns to ranged deps; a fresh env would again risk the NumPy-2/torch mismatch). To move forward to a NumPy-2 stack instead, bump torch $\geq$ 2.3 and the backends to their numba-0.66 releases together.

3a6ecb9 — Calibrate Results: all-text multi-column readout (drop distortion table) (2026-07-14)

Effect: The Calibrate **Results** tab is now entirely text. Removed the distortion `QWidget`; the distortion coefficients appear in the same multi-column parameter grid, with the paramtest `p0–p14` slots relabelled to their names (`iso_R2`, `a1`, `phi1`, ...) via `helpers._PARAMTEST_DISTORTION`. Larger font (12 pt) and roomier row/column spacing for readability. Removed the `DistortionTable` import + `set_distortion` call. **Files:** `tab_calibrate.py`, `documentation/gui_documentation.md`. **Roll back:** `git revert 3a6ecb9` (restores the named-distortion table widget below the grid). `DistortionTable` still exists in `widgets.py` (used only here), so a revert is clean.

b1642fa — Fix calibration `TypeError` (initial_BC_y) + add scikit-image (2026-07-14)

Effect: Fixes calibration failing with `calibrate()` got an unexpected keyword argument `'initial_BC_y'` on the pinned (base-matching) `midas-calibrate-v2` 0.3.3, whose `calibrate()` has no beam-centre seed parameter (only newer backends add it). New `calib._supported_kwargs(fn, kwargs)` filters kwargs to the installed callable's signature (keeps `initial_Lsd`, drops the unsupported `initial_BC_y/z`, logs it), so the GUI tolerates backend-version signature drift. Also pins **scikit-image=0.23.2** in `environment.yml` — `midas-calibrate-v2`'s `auto_seed_calibrant` needs it; without it, seeding degrades to the coarse arc fallback. Verified: manual-seed one_shot calibration of the shipped ceria runs end-to-end (numpy 1.26.4 + torch 2.4.0). **Files:** `calib.py`, `environment.yml`. **Roll back:** `git revert b1642fa` (reintroduces the `TypeError` on backends lacking the BC-seed args, and removes the `scikit-image` pin).

Rollback recipes (common intents)

- **Undo the Pump Probe tab only:** `git revert 590b410` removes Pump Probe *and* modular tabs. To drop Pump Probe alone, hand-remove `midas_gui/tab_pumpprobe.py`, its import/construction/wiring in `app.py`, `PumpProbeWorker` in `workers.py`, and its entry in `constants.OPTIONAL_TABS / DEFAULT_VISIBLE_TABS`.
- **Undo modular tabs (show all 10 fixed again):** remove the `apply_tab_visibility` logic in `app.py` (add all tabs directly), the Tabs section in `prefs_dialog.py`, and the tab-list constants — see the `590b410` diff for the exact hunks.
- **Undo the config system:** `git revert d30be2c` — but first revert `590b410`'s config touches, since it extends the same `ui` overlay and Preferences dialog.

- **Revert the azimuthal-averaging change:** don't blanket-revert `41f28f5` (bundled with UI); instead set the `weighted` default back to the legacy η -bin mean in the batch/pump workers.
- **Go back to the pre-3-panel single-column tabs:** `aa9395e` is the pivot; a revert is large and cascades to later tabs — prefer fixing forward.
